

VEHICLE ALERT KIT

ABSTRACT

A vehicle alert kit includes at least one base member having a substantially planar bottom surface and a threaded portion integral therewith. The kit further includes a mechanism for fastening at least one base member to a surface so that same can be maintained at a substantially secure position. The kit further includes an elongated support member having a lower end portion threadably attachable to a select one of at least one base member. The elongated support member extends substantially vertically and upwardly from the base member to a predetermined height, and includes a receiving portion extending substantially vertically along a length thereof and having a bottom surface. The kit further includes a flag having indicia printed thereon and including an edge portion selectively engageable with the receiving portion.
